No. DIP 595
**DIP 595 Calf and Heifer Housing System for 650 Cow Herd**

This plan illustrates how to assemble a complete system using some or all of the features found in five different Penn State Dairy Idea Plans and is intended for a dairy herd with about 650 mature dairy cows (females that have calved at least once), assumes a 24 month age at first calving and animals are moved to a pre-fresh group one month prior to calving. It provides space for 595 animals, in 16 groups, from birth to one month pre-fresh.

![Diagram of Calf and Heifer Housing System](image)

The system includes individual calf hutches **DIP 501: Calf Hutches with Yard**, weaned calf shelter **DIP 511: Weaned Calf Shelter**, bedded pack shelter **DIP 533: Bedded Pack Shelter**, freestall shelter **DIP 559: Heifer Freestall Shelter** and utility building **DIP 583: Multi-Purpose Utility Building Separate Room with Large Door Storage Area -12’x24’**.

**Sizing and Selecting Components**

The number and distribution of heifer calves and the growth rate of these animals will vary from herd to herd and year to year in the same herd. Therefore sizing and selecting buildings for a calf and heifer raising system for a particular size herd will always be an estimate. The breeding program, heifer to bull ratio and average daily rate of gain are the variables that have the biggest impact on housing system space requirements.

The following procedure was used to size this example system.

- Assume 1.05 calvings per cow in herd per year \( 650 \times 1.05 = 682.5 \text{ calves} \)
- Calves per month \( 682.5/12 = 56.9 \text{ per calves month} \)
- 1:1 heifer: bull ratio \( 56.9/2 = 28.5 \text{ heifers per month} \)
- 95% of heifer calves are raised \( 28.5 \times 0.95 = 27 \text{ calves raised per month} \)
- 24 month total grow out period \( 24 \times 27 = 649 \text{ total animals} \)
- Assume 6-8 weeks in individual housing and 6-8 weeks in weaned calf pens
- Oversize facilities of birth to 300 pounds by 50% to account for variability in numbers of heifer calves and to allow for sanitation and resting between animals.
- System will house animals to approximately one month prior to freshening (23 months).

**Planning a Calf and Heifer Raising System**

A well planned calf and heifer raising system provides a clean, dry and comfortable home for all animals and flexibility to accommodate the changing needs and numbers of dairy animals from birth to calving. There are a variety of stages in a heifer's life based on age, weight, health or management needs and housing types. Adequate quality space is especially critical for baby calves (birth to weaning) and the weaned calf during the first group living experience to 300 pounds. Housing for these early groups is increased by 50 percent over the average number of animals expected to allow adequate time for cleaning, disinfecting and resting of the pens to minimize disease build up and to account for variation in animal numbers.

Once animals are well adapted to group living, eating solid feed and have reached 500 pounds there are a wide variety of housing systems that can provide for their needs. Special attention for observation and restraint are important for breeding age animals. Flexibility of size and use of facilities is important as bulges in animal numbers from irregular calvings and changes in the bull to heifer ratio work their way through the system.

**Specific items to consider include:**

- Changing needs of the growing animals - space, feed, management
- Natural and planned variability in calving patterns including numbers of calvings per month and sex of animals
- Variation in health and death loss
- Changes in management goals
- Animal observation, restraint and treatment requirements at various ages and sizes
- Biosafety - minimize disease transmission among calves and heifers, from mature animals on the farm, by workers and equipment and from off farm sources including invited and uninvited visitors. Diseases normally are spread from older to younger animals by direct contact, manure, drainage water or contaminated ventilation air.

**Items to consider include:**

- Chore patterns, manure flow, air flow and animal movement within and between buildings and age groups
- Shared equipment
- Vectors
- Visitors
